

Missoula's next 43,000 homes are already on the books

The adopted Growth Policy makes room to nearly double the city's housing stock on vacant and underbuilt land — half of it small-scale infill, a third of it clustered in just 4% of the city.

Missoula's untapped housing capacity clusters in a few corridors

Each hex is scored by how much plan-enabled capacity it and its neighbors hold. Green hexes hold significantly more than random arrangement would produce (Getis-Ord Gi*); darker green = stronger statistical evidence.

Source: City of Missoula taxlot data (2024). Analysis: capacity gap between Growth Policy future land use and existing dwelling units on unconstrained, economically soft parcels.

The counterpoint: 530 mobile-home parcels ($\approx 2,850$ of Missoula's most affordable homes) sit on land planned for higher density. They are excluded from the opportunity count — and are where preservation policy must move first.

$\approx 43,000$

plan-enabled homes on 3,419 vacant and underbuilt parcels — no plan change needed

54%

of capacity is infill on parcels ≤ 5 acres — unlocked by code, not land assembly

1/3

of capacity sits in 40 hot spots — just $\approx 3\%$ of the urban fabric

The Growth Policy already makes room for $\approx 43,000$ more homes

Dwelling units by Growth Policy future land-use designation (not current zoning): today vs. with capacity on vacant and underbuilt parcels

Plan-enabled capacity = allowable density x developable acres on unconstrained soft parcels, net of existing units. Densities: midpoints of the adopted 2035 Growth Policy designation ranges.

What this means for the code reform

1. Align zoning with the plan in the hot-spot corridors (Mullan/Sxwtpqyen, midtown, south hills) — that's where entitlement friction costs the most homes.
2. Make small infill by-right: half the capacity sits on parcels a small builder can develop under simple rules.
3. Pair upzoning with mobile-home park preservation before surrounding land values move.
